

Supply Chain Profit Analysis Dashboard using Python and Streamlit

Abstract

Interactive dashboard built using Python, Pandas, Plotly and Streamlit for logistics and supply chain analytics.

Introduction

The dashboard analyzes sales, profit, customer segments, shipping modes and product performance.

Problem Statement

Businesses require interactive analytics for supply chain decision-making.

Objectives

Clean data, perform EDA, build dashboard, generate business insights.

Dataset

APL Logistics dataset with 180519 records and 40 columns.

Methodology

Data Collection → Cleaning → Feature Engineering → EDA → Dashboard.

Dashboard Features

KPIs, filters, charts, download filtered data.

Business Insights

High-performing categories, market profitability, shipping analysis and customer segmentation.

Conclusion

Interactive analytics improves decision making.

Future Scope

Machine learning forecasting, cloud deployment, real-time analytics.
